

1.1MW Compact Series Standby Generator

Turbine Marine Inc. introduces the Compact Series 1.1 MW, turbine-powered standby generator. This unit is so compact, it is easily towed with a standard size pickup truck as its weight is under 9500 lbs. and its overall dimensions are 12'L x 5'W. Its enclosure is sleek and aerodynamic to reduce drag while in tow. The Compact Series 1.1 megawatt generator (1,100 kilowatts) is powered by military Lycoming T-53, 1,750 hp turbine engines. It has the capability of using multiple fuels including, but not limited to; jet, diesel, gasoline and bio-fuels, without any changes to the unit by the user. A natural gas version is also available by special order.

The COMPACT SERIES is manufactured using only the highest industry standard components, such as Stamford NewAge Generators (alternator) and Woodward Electrical controls for engine management and electrical current monitoring. The unit has a full digital control panel that is also capable of synchronizing multiple generator units. The 1.1 MW generator assemblies can be ordered in any Hz or voltage configuration that the application may demand.

Turbine Marine offers standard and custom turbine generator packages to serve your power needs.
